

Project - Step 2: Roles and Communication Relations

Set up Cloud instances that incorporate several Personas:

- Several Organizations
- Several Persons
- A single central organization

All these instances need to communicate via the central organization (a bank transfer is a form of communication ..).

- Make sure all communication partners know each other as far as it is necessary. (follow up question: where is it not necessary?)
- Since an organization needs people that act on their behalf, make sure that a particular person indeed represents a particular organization.
- What is necessary if a person represents an organization during work but has a "private life", too?

Consider the following JSON listing for the server as an example on how you can model an organization:

```
1 {
2   "organizations": [
3     {
4       "name": "ORGANIZATION1",
5       "roles": [
6         "ROLE1",
7         "ROLE2",
8         ...
9       ],
10      "employees": [
11        {
12          "id": "ID",
13          "roles": [
14            "ROLE1",
15            ...
16          ]
17        }
18      ]
19    },
20    ...
21  ]
22 }
```
